                                                                                   Clone pTOM5 was derived from a cDNA library isolated from ripe tomato RNA (Slater et al., Plant Molecular Biology 5, 137-147, 1985). The protein it encodes is estimated to have mol. wt. ca. 48kD. pTOM5 is expressed in ripening fruit. Strongest expressic at the full orange stage of ripening; no expression is detected green fruit. See also AAQ12494. (Updated on 25-MAR-2003 to correct PA field.)

The phytoene synthetase coding sequence represents a cDNA of the invention. The isolated nucleic acid molecules are used for producing recombinant polypeptides or transgenic plants with enhanced ability to synthesise carotenoids. Phytoene has been used as a ultra violet absorber and other carotenoids have been used as food colours, animal feeds and in the pharmaceutical and cosmetics industries.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence encodes a phytoene synthase polypeptide, which is used in the method of the invention. The specification describes methods for the inhibition and control of gibberellic acid levels. Gibberellic acid levels may be inhibited or controlled by use of a chimeric expression construct expressing a RNA or protein which suppresses the gibberellin biosynthetic pathway sequence, diverts substrate from the pathway, or degrades pathway substrates or products. The methods uses copally diphosphate synthase, Jbeta-hydroxylase, 2-oxidase, phytoene synthase, C-20 oxidase, and a 2beta, 3beta-hydroxylase polymucleotides to achieve this. The method is used to control seed germination and seedling growth especially to regulate gene products of gibberellin biosynthetic pathway and responsed to are gibberellin deficient, and have shortened hypocotyl and/or epicotyl phenotypes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Obtaining transgenic plant useful for controlling seed germination seedling growth comprises transgene comprising a sequence expressir altered levels of an essential hormone

The method involves producing transgenic plants having a phenotype of reduced seed germination and reduced early seedling growth, then restoring seed germination and reduced early seedling growth, then creating seed germination and early seedling growth by treating plants with an appropriate compound when conditions are favourable. The method is useful to control seed germination and/or early seedling creating to conditions normally reducing agronomic output can be avoided and creation, emergence and seedling visor, so increasing yields at harvest. The method is especially useful in crop plants such as e.g. canola, soybean, cotton, etc., and is also useful in storage and transport of seeds to reduce premature germination which may affect agronomic or food quality of the seeds. The present sequence is tomato phytoene synthase cDNA. This cDNA is used in exemplification of the invention.

It was isolated from a cDNA library prepared from mRNA extracted from the petals of Gentiana lutea. The nucleic acid sequence was amplified from the library using PCR primers AAV16552-53. The phytoene synthase gene is useful for breeding plants with variable flower colours.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 2868 BP;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      밁
                                        The present sequence encodes phytoene synthase 2. It was isolated from a cDNA library prepared from mRNA extracted from the petals of Gentian lutea. The nucleic acid sequence was amplified from the library using PCR primers AAVI6952-53. The phytoene synthase gene is useful for breeding plants with variable flower colours.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 06-JUL-1998

                                                                                                                                                               The present sequence encodes phytoene synthase 1. It was isolated from a cDNA library prepared from mRNA extracted from the petals of Gentiana lutea. The nucleic acid sequence was amplified from the library using PCR primers AAVI6952-53. The phytoene synthase gene is useful for breeding plants with variable flower colours.

It was isolated from a CDNA library prepared from mRNA extracted from the petals of Gentiana lutea. The nucleic acid sequence was amplified from the library using PCR primers AAVL6952-53. The phytoene synthase gene is useful for breeding plants with variable flower colours.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

US-09-180-342-1

[Sequence 1, Application US/09180342A]

Patent No. 623931

[GENERAL INFORMATION:
APPLICANT: Drake, Caroline R.
APPLICANT: Schuch, Wolfgang W.
APPLICANT: Schuch, Wolfgang W.
TITLE OF INVENTION: Enhancement of Gene Expression
FILE REFERENCE: SEE50156

[CURRENT APPLICATION NUMBER: US/09/180,342A]
[CURRENT FILING DATE: 1998-11-05
EARLIER APPLICATION NUMBER: PCT/GB97/01414
EARLIER APPLICATION NUMBER: US 9611981.3
EARLIER APPLICATION NUMBER: US 9611981.3
EARLIER FILING DATE: 1996-06-07
NUMBER: OF SEQ ID NOS: 3
SOFTWARE: PatentIn Ver. 2.0
